Background

Up to this point, you have received grading/feedback from your graduate student mentor on completed assignments and have been given the opportunity to revise your submission to get more points. For your 3rd paper, you will be required to go through a more formal review and revision process.

Assignment

Upon submission of your 3rd paper assignment (or ideally before you submit it), you should reach out to an additional graduate student in the FLOW Lab and ask for them to review your paper (just the paper, not the code).

1. Upon receiving feedback from your graduate student mentor and the other graduate student, start a new branch on your repository. Name it something relevant to the project.

2. Compile the feedback you received and complete revisions on your paper.

3. Produce a "Diff" document that highlights the changes you made between drafts.

4. Also include a basic written document describing what feedback you applied and what changes you made based on specific feedback items.

Hints:

– To create your "Diff" document, you can either utilize multiple branches, or commits to save the versions of your prospectus. You can then use a LaTeX diff tool (e.g. latexdiff) to highlight the changes you have made to your document.

– Diff files and git merges of LaTeX files are somewhat easier if you only put one sentence per line. Remember a single newline will continue the paragraph in LaTeX, while a double return will initiate a new paragraph.
